

Balboa Control Systems

A new energy-efficiency standard on self-contained swim spas / exercise spas went into effect in June 2019 reducing the maximum temperature to 99 degrees.

To change the maximum temperature setting from 99 degrees to 104 degrees, first power the spa down by turning off the 50 amp GFCI breaker, then open the control box and access the spa circuit board. Next locate the DIP switches in the upper right corner of the board and move DIP switch number 5 (second from the right) to the 'off' or down position. Then reassemble the spa and turn the spa GFCI breakers back on.

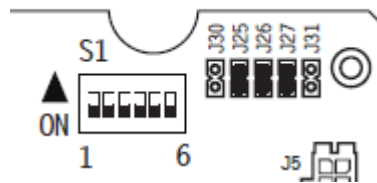

With the spa in your possession, you as the owner are free to change the setting.

Your business is appreciated.

This is the control box:

Here is the detail of the DIP Switches
